

Introduction to Analytical Chemistry

DR.S. ANAND GIRI

ANALYTICAL CHEMISTRY

Ph.D. Jadavpur University

Kolkata, India

The study of the **chemical composition** of natural and artificial materials.....

Chemical Composition

Geometric features

e.g. **molecular morphologies** and **distributions of species** within a sample

Single dimensional features

e.g. **percent composition** and **species identity.**

Practical Applications

1. Biomedical applications

(bioanalytical...) (Cancer !!! Chemicals present in blood !)

2. Environmental monitoring.

(e.g. how much lead in drinking water?)

3. Control of industrial manufacturing

- Industrial Quality Assurance (QA)

4. Forensic science

Analytical chemistry is concerned with questions such as

what are their characteristics?

"what chemicals are present?"

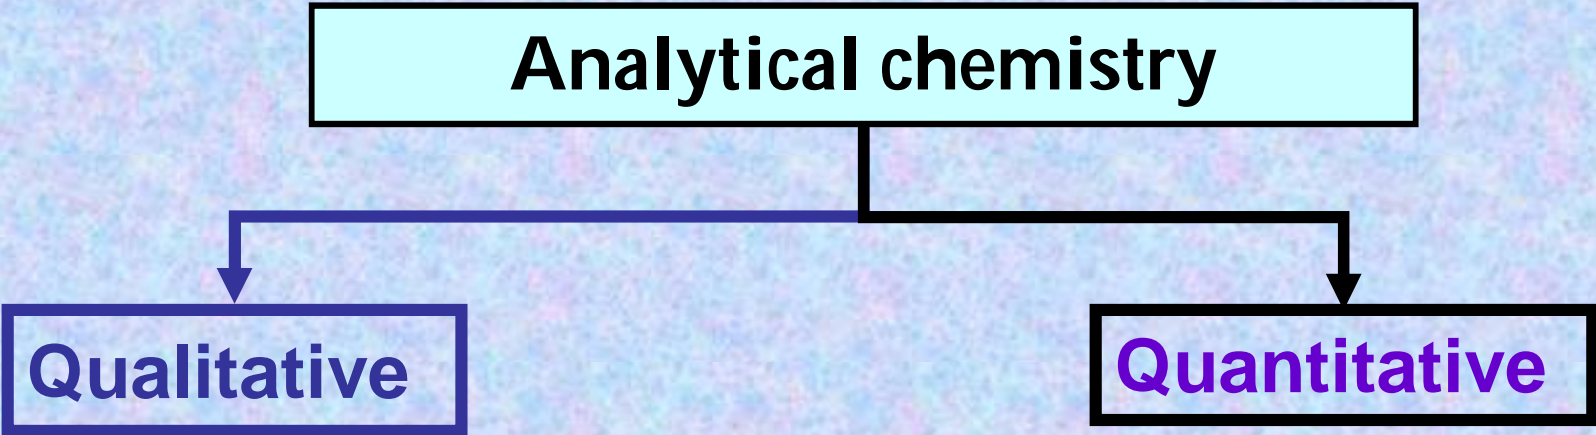

what quantities are they present?

It stops after they are answered

Modern analytical chemistry

- Dominated by **instrumental analysis**
- Academics tend to either **focus on new applications and discoveries** or on new methods of analysis.
- Analytical chemistry plays an important role in the **pharmaceutical industry** e.g. **discovery of new drug ,**
- **understanding the interactions between the drug and the patient**

Analytical chemistry

```
graph TD; A[Analytical chemistry] --> B[Qualitative]; A --> C[Quantitative];
```

Qualitative

Description of chemical composition in terms of

- elements, compounds,
- or structural units

Quantitative

The measurement of the amount of a given element or compound in a sample

Analytical Methods

```
graph TD; A[Analytical Methods] --> B[Classical]; A --> C[Instrumental];
```

Classical

The use of simple apparatus
e.g. **burettes, pipettes and
weighing balances**

Instrumental

The use of **electronic
equipments** that generate
electrical signals related to
some property of the
substance being analysed

Classical Analytical Methods

```
graph TD; A[Classical Analytical Methods] --> B[Titrimetry/ Volumetric]; A --> C[Gravimetry]; A --> D[Inorganic qualitative analysis];
```

Titrimetry/ Volumetric

Involves the **addition of a reactant to a solution** being analyzed **until some equivalence point is reached** Acid-base, Redox, precipitation & complexometric titrations.

Gravimetry

Determination of the amount of material present by **weighing the sample before and/or after** some transformation. Amount of water in a hydrate- difference in weight -remove the water by heating.

Inorganic qualitative analysis

Classical Analytical Methods

Titrimetry/ Volumetric

Involves the **addition of a reactant to a solution** being analyzed **until some equivalence point is reached**

Gravimetry

Determination of the amount of material present by **weighing the sample before and/or after** some transformation

Inorganic qualitative analysis

Systematic scheme to confirm the presence of ions or elements (usually aqueous) by a series of reactions.

Instrumental Methods

```
graph TD; A[Instrumental Methods] --> B[1. Spectroscopy]; A --> C[2. Mass Spectrometry]; A --> D[3. Crystallography];
```

1. Spectroscopy

Measures the interaction of the **atoms or molecules with electromagnetic radiation**
e.g. AAS, AES, UV, IR, RS, NMR...

2. Mass Spectrometry

Measures **mass-to-charge ratio** of molecules using electric and magnetic fields.

3. Crystallography

Characterizes the chemical structure of materials at the atomic level usually by using x-rays

Instrumental Methods

4. Electrochemical Analysis

Measures the interaction of the material with an electric field e.g. **potentiometry, amperometry, coulometry**

5. Thermal analysis

Measures the **interaction of a material with heat**. e.g. Calorimetry and thermogravimetric analysis

6. Separation

Decreases the complexity of material mixtures
e.g. **Chromatography and electrophoresis**

Instrumental Methods

7. Hybrid Techniques

Hybrid or hyphenated techniques- Combinations of the above techniques

e.g. **Gas Chromatography-Mass Spectrometry, GC-IR, LC-NMR, Capillary Electrophoresis-Mass Spectrometry (CEMS)**

8. Microscopy

The visualization of **single molecules, single cells, biological tissues** and nano-micro materials- **optical microscopy, electron microscopy, scanning probe microscopy,**

9. Lab-on-a-chip

Micro total analysis System (μ TAS)

A whole device can be visualized under a microscope.

Instrumental Methods

7. Hybrid Techniques

Combinations of the above techniques e.g. **GC-MS, GC-IR, LC-NMR, CE-MS**

8. Microscopy

The visualization of **single molecules, single cells, biological tissues** and nano- micro materials

9. Lab-on-a-chip

Micro total analysis System (μ TAS)
A whole device can be visualized under a microscope.

4 major components – 1) a sensor covert a solution property into weak signal
2) a signal processor –amplify the signal 3) a readout device 4) a power supply

Instrumental Analysis

Input Transducer
(detector)

Stimulus

- Light
- Heat
- Current
- Voltage

Sample

Signal
Processor

- Amplifier
- digitizer

Read out

- Meter
- Plotter
- Computer

Introducing Samples & standards into an instrument

- They can be sucked into the instrument

- Be placed inside the instrument

Methods and data analysis

```
graph TD; A[Methods and data analysis] --> B[Calibration Curves]; A --> C[Standard Addition]; A --> D[Internal Standards]
```

The diagram is a flowchart with a central box at the top labeled 'Methods and data analysis'. From the bottom of this box, a blue line extends downwards and then branches out to the left and right. The left branch leads to a box labeled 'Calibration Curves'. The right branch leads to a box labeled 'Standard Addition'. A separate black line extends from the right side of the 'Methods and data analysis' box, leading to a box labeled 'Internal Standards'.

Calibration Curves

Standard Addition

Internal Standards

- **Standard Solutions**; solutions with known concentration of analyte
- **Blank solutions** ; Solutions containing all reagents except the analyte
- **Matrix**; the components of a sample other than the analyte

Methods and data analysis

Linear Calibration Curve

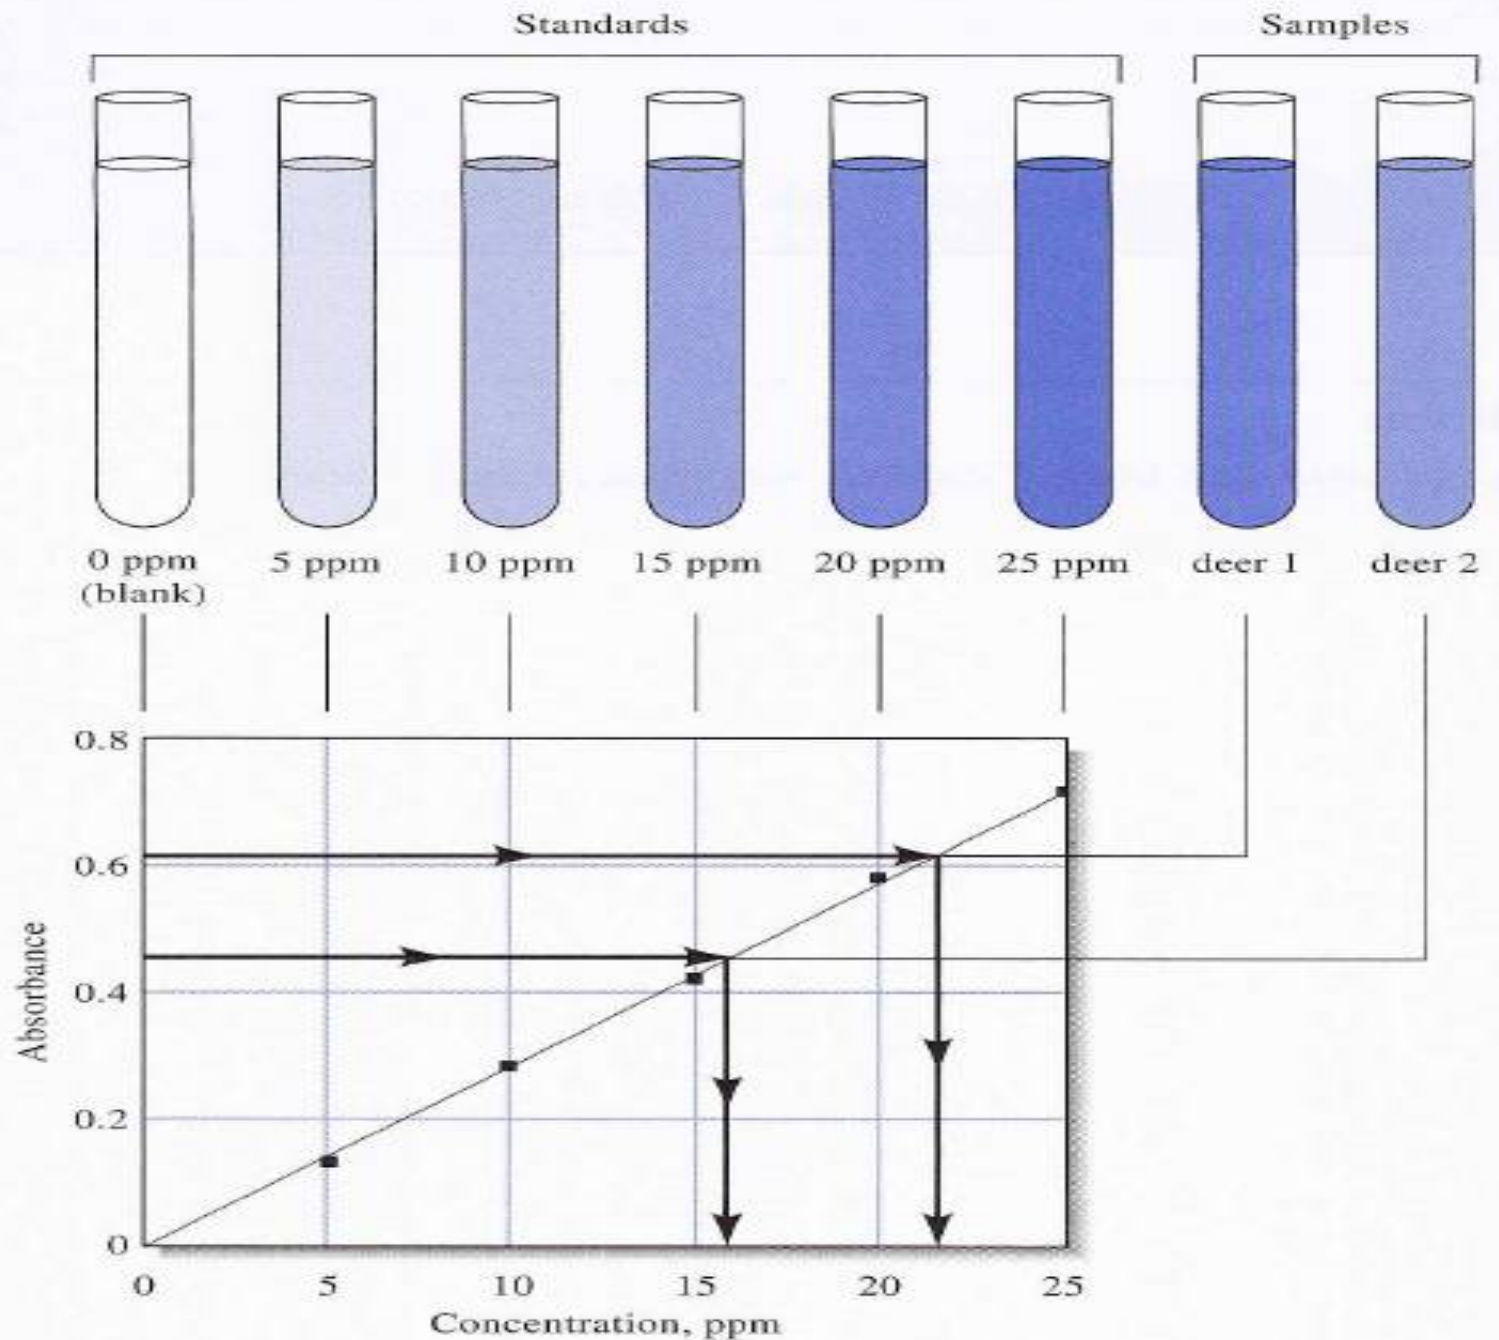

a graph of instrument signal versus analyte concentration

It can also be defined as:

the response of a method to known quantities of analyte.

Several standards (with different concentration) containing exactly known concentrations of the analyte are measured and the responses recorded

Linear calibration curve

Least Square Method – to get a linear calibration curve from scattered data

Least Square Method - Linear calibration curve

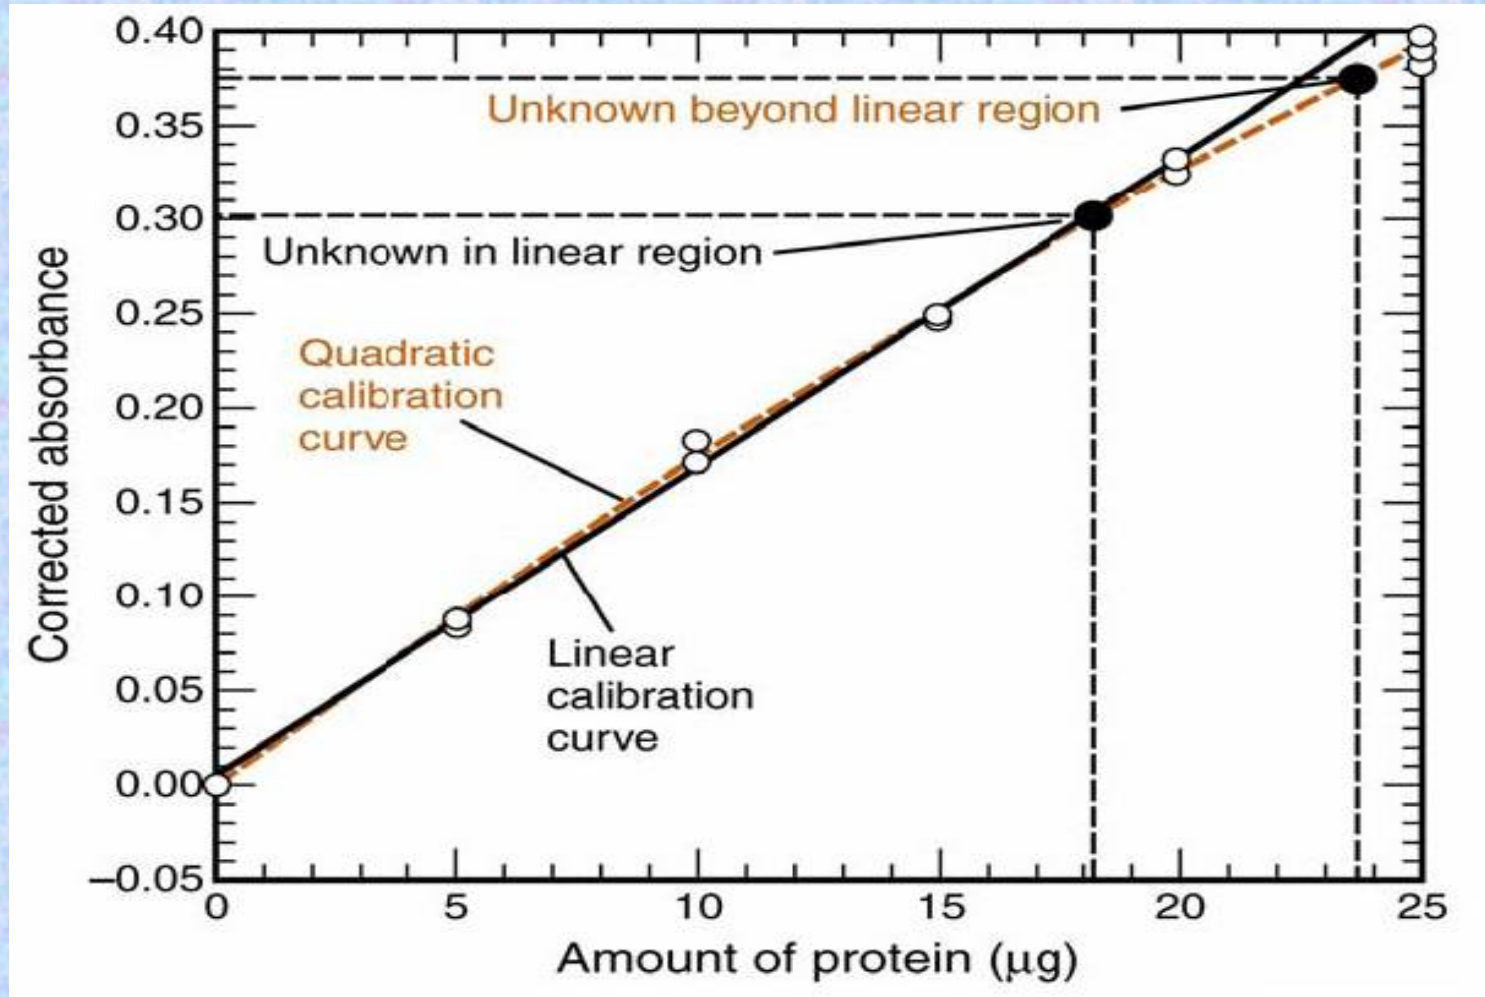

to solve for conc of unknown, x:

4/3/2011

$$y = mx + c$$

$$x = \frac{y - c}{m}$$

Calibration Curve for Absorbance of a Protein

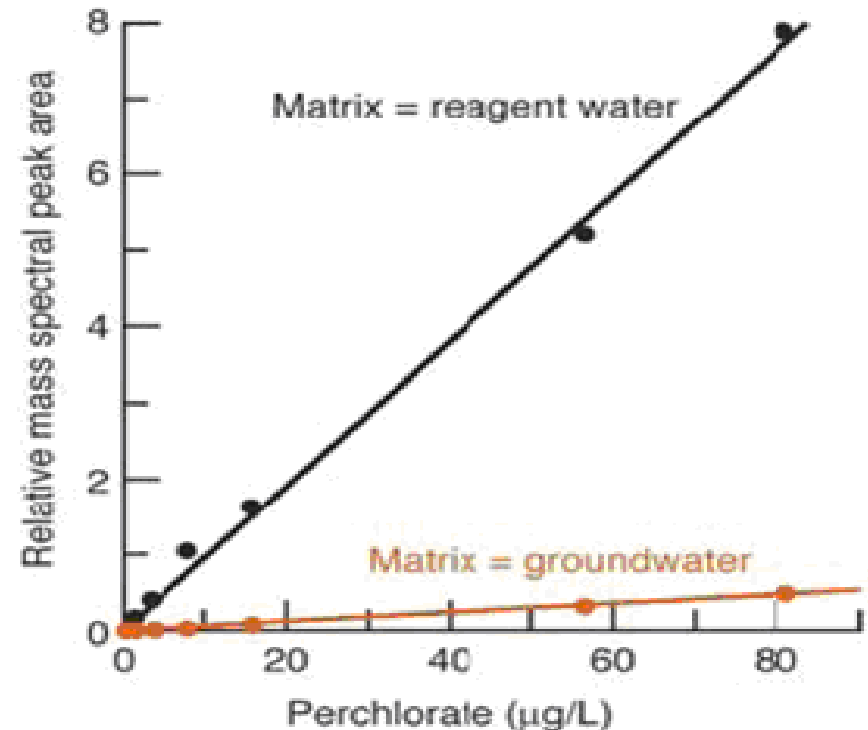

Methods and data analysis

2- Using Standard addition;

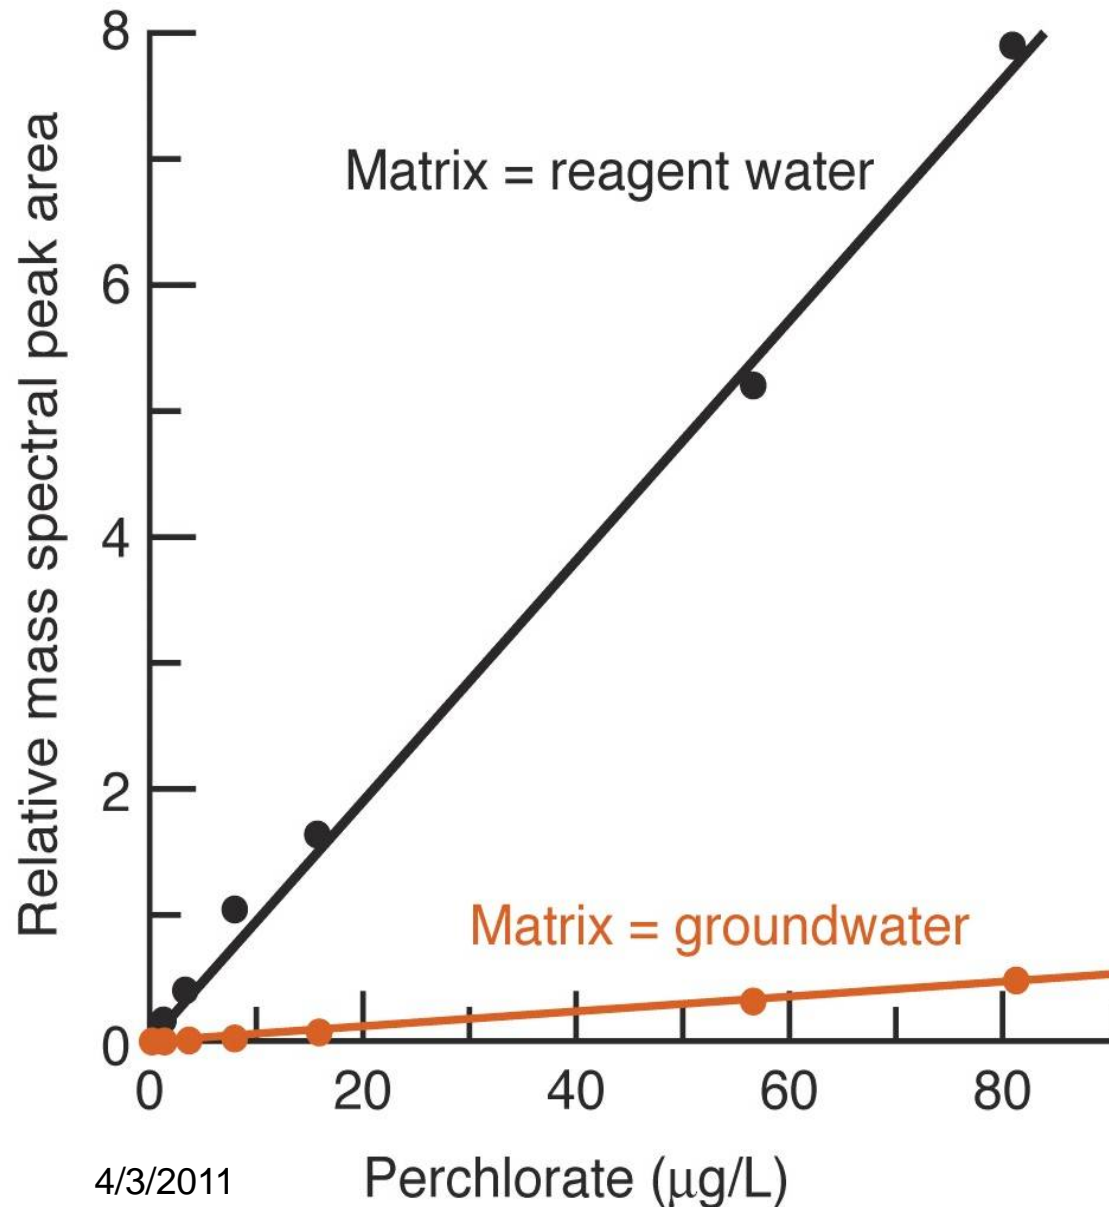

Known quantities of analyte are added to the unknown.

- When matrix effects can be substantial
- Standards are added directly to aliquots of the sample, therefore matrix components are the same.

- **Matrix**; anything in the sample other than the analyte.
- **Matrix effect**; a change in the analytical signal caused by anything in the sample other than analyte.

Calibration Curve for Perchlorate with Different Matrices

- Perchlorate (ClO_4^-) in drinking water affects production of thyroid hormone. ClO_4^- is usually detected by mass spectrometry (Ch. 22), but the response of the analyte is affected by other species, so you can see the response of calibration standards is very different from real samples.
- Application of standard addition method

Standard addition

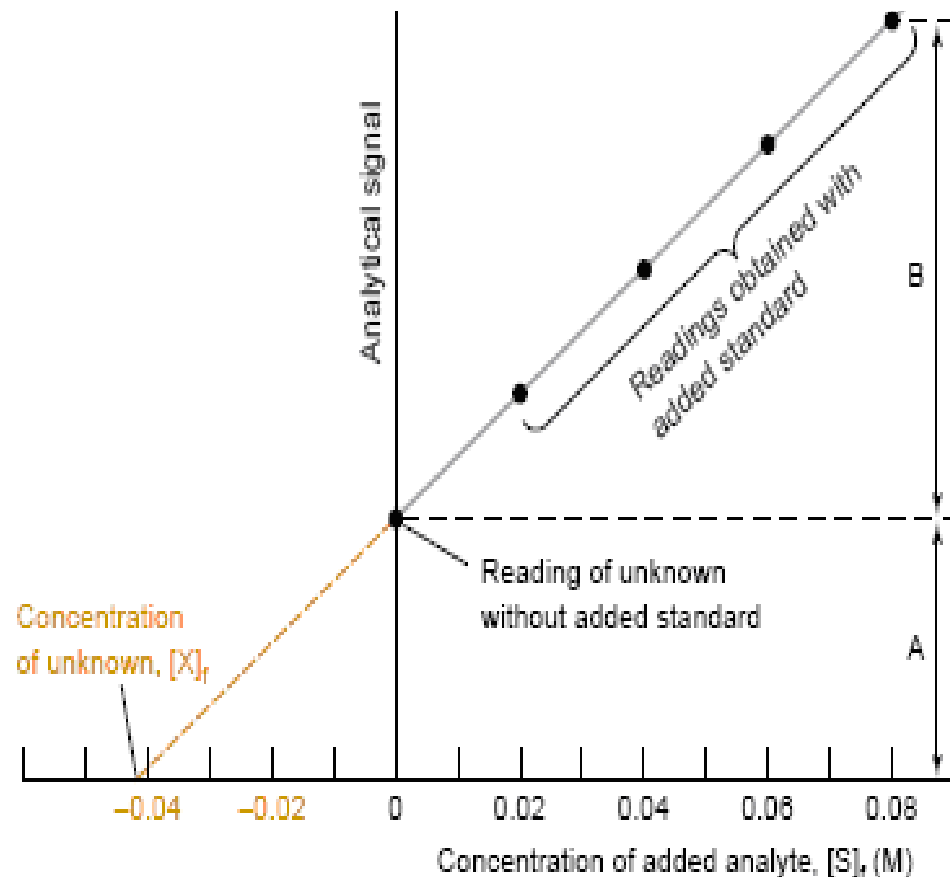

Place 5 mL of unknown in each flask

Add 0, 5, 10, 15, or 20 mL of standard

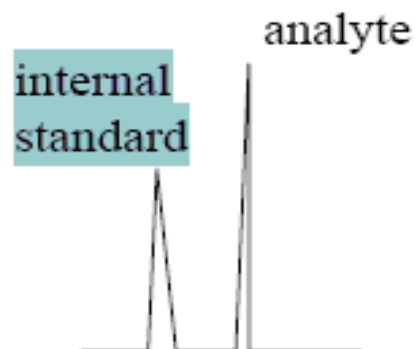

Fill each flask to the 50-mL mark and mix

Methods and data analysis

3- Using Internal Standards is a substance different from analyte that is added in a constant amount to all samples, blanks and calibration standards in an analysis.

Run 1:

Run 2: You injected a slightly smaller volume.

$$\frac{\text{Area of analyte signal}}{\text{Concentration of analyte}} = F \left(\frac{\text{area of standard signal}}{\text{concentration of standard}} \right)$$

$$\frac{A_X}{[X]} = F \left(\frac{A_S}{[S]} \right)$$

Example

- In an experiment, a solution containing 0.0837 M analyte (X) and 0.0666 M standard (S) gave peak areas of $A_x=423$ and $A_s=347$ (areas in arbitrary units).
- To determine an unknown concentration of the analyte (X), 10.0 mL of 0.0146 M standard (S) was added to 10.0 mL of the unknown solution then the mixture was diluted to 25.0 mL in a volumetric flask. Analysis of this mixture resulted in peak areas of $A_x=553$ and $A_s=582$.

Answer

1

$$\frac{A_x}{[X]} = F \left(\frac{A_s}{[S]} \right)$$

$$\frac{423}{0.0837} = F \left(\frac{347}{0.0666} \right)$$

$$F = 0.970$$

2

$$[S] = (0.146 \text{ M}) \left(\frac{10.0}{25.0} \right) = 0.0584 \text{ M}$$

Initial
Concentration

Dilution
factor

3

$$\frac{A_x}{[X]} = F \left(\frac{A_s}{[S]} \right)$$

$$\frac{553}{[X]} = 0.970 \left(\frac{582}{0.0584} \right)$$

$$[X] = 0.0572 \text{ M}$$

4

$$[X] = (0.0572 \text{ M}) \left(\frac{25.0}{10.0} \right) = 0.143 \text{ M}$$

General steps in any Chemical analysis

Select method

Obtain a representative sample

Prepare a laboratory sample

Define replicate samples

Eliminate interferences

Measure property of analyte

Calculate results

Estimate the reliability of results

Instrumental Analysis

1- Obtain the sample.

2- Prepare the sample.

3- Prepare blanks and reference standards.

4- Obtain instrumental reading.

5- Use the data to calculate and/or plot the desired result.

6- Report and interpret the results.
