**Kolkata, India**

Molecular Spectroscopy 2010

# What is Spectroscopy?

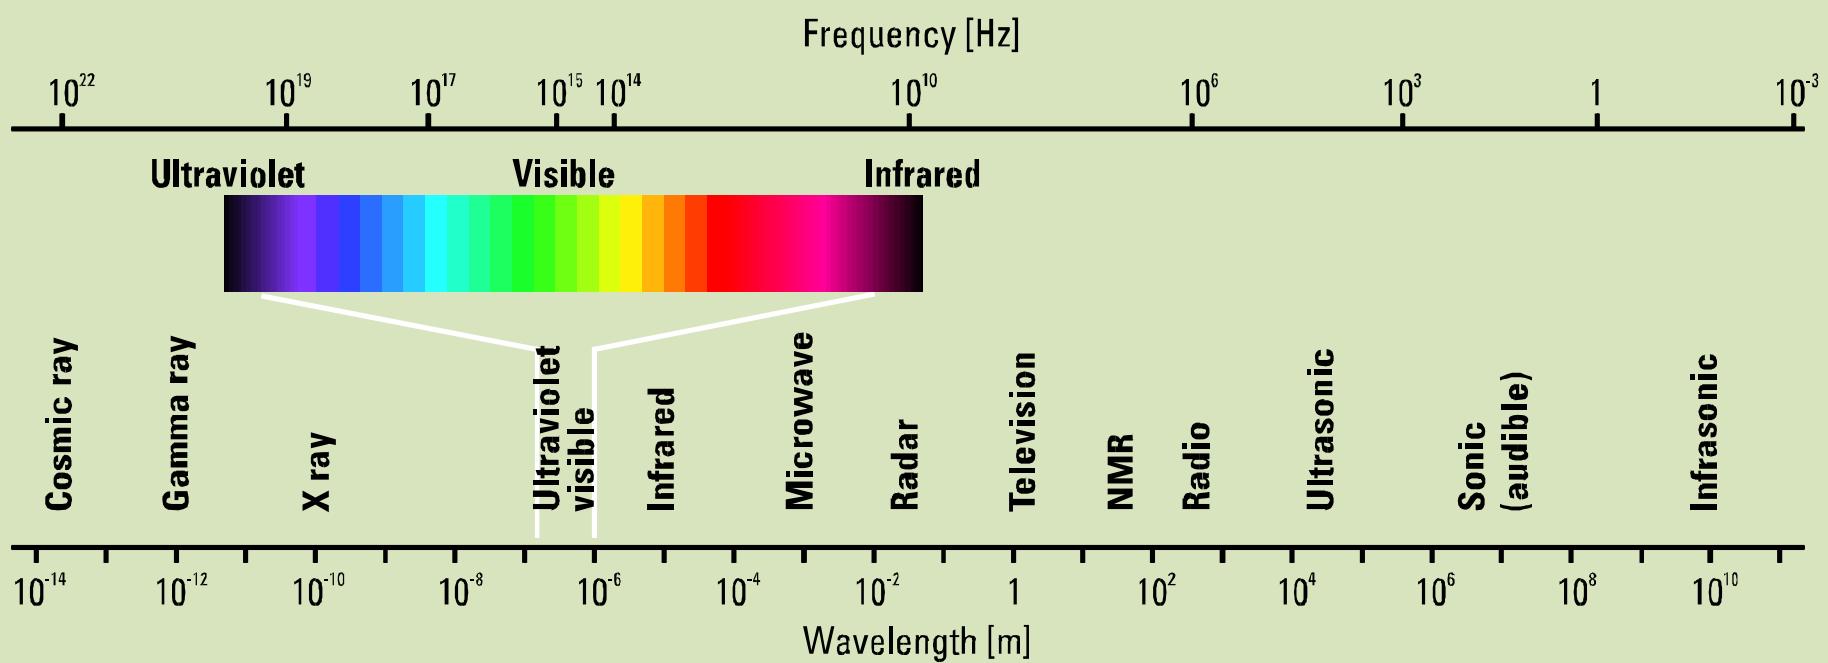

- The study of molecular structure and dynamics through the absorption, emission and scattering of light.

## What is Light?

- According to Maxwell, light is an electromagnetic field characterized by a frequency  $f$ , velocity  $v$ , and wavelength  $\lambda$ . Light obeys the relationship

$$f = v / \lambda.$$

# The Electromagnetic Spectrum

$$E = h\nu$$

$$\nu = c / \lambda$$

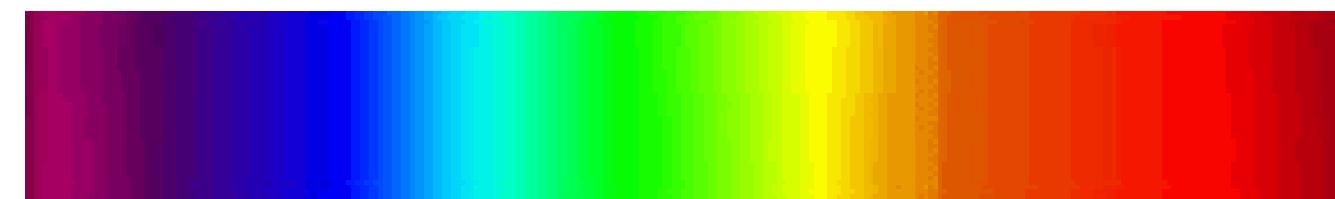

# Visible Spectrum

Higher Frequency

Lower Frequency

UV

IR

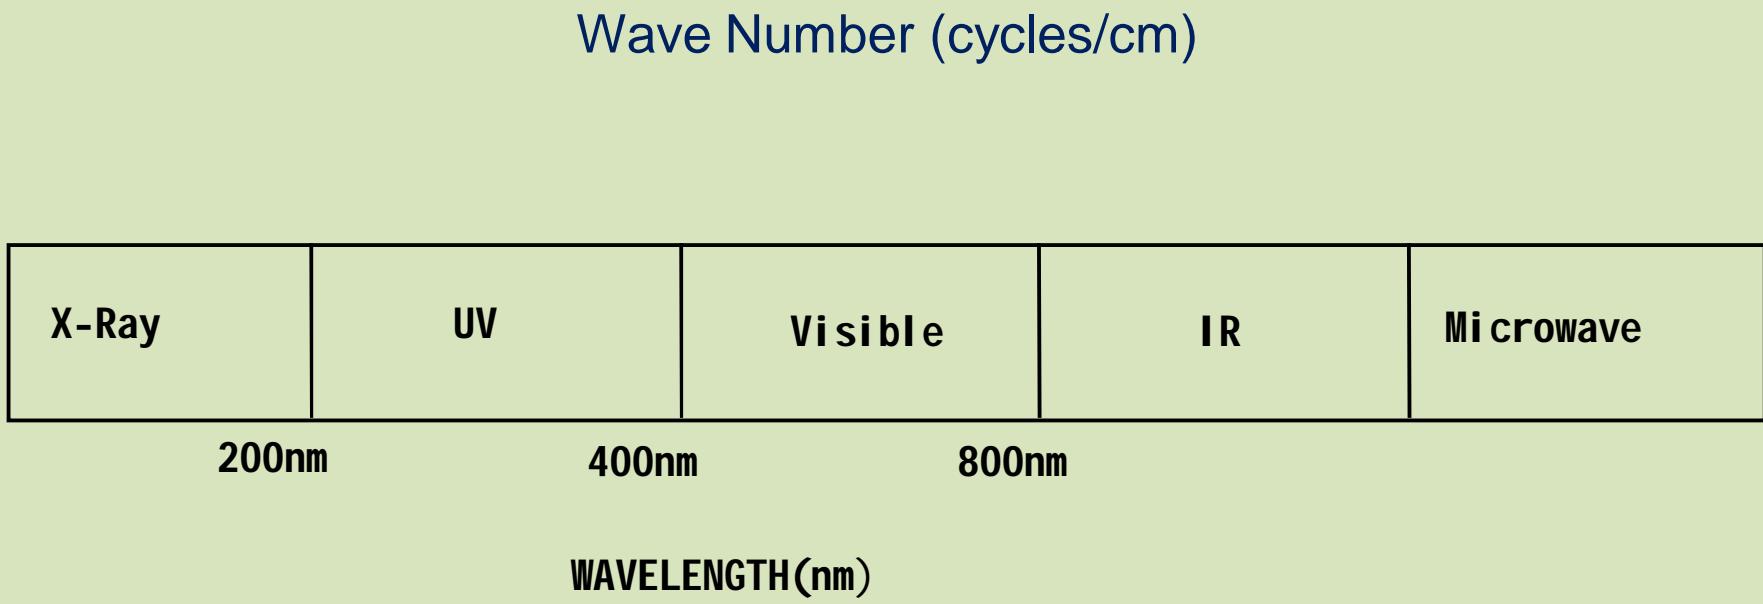

400 500 600 700 800

Wavelength in nanometers

- Ultraviolet: 190~400nm
- Violet: 400 - 420 nm
- Indigo: 420 - 440 nm
- Blue: 440 - 490 nm
- Green: 490 - 570 nm
- Yellow: 570 - 585 nm
- Orange: 585 - 620 nm
- Red: 620 - 780 nm

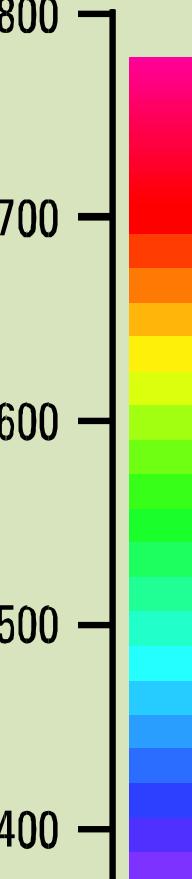

# Spectroscopy

## Spectral Distribution of Radiant Energy

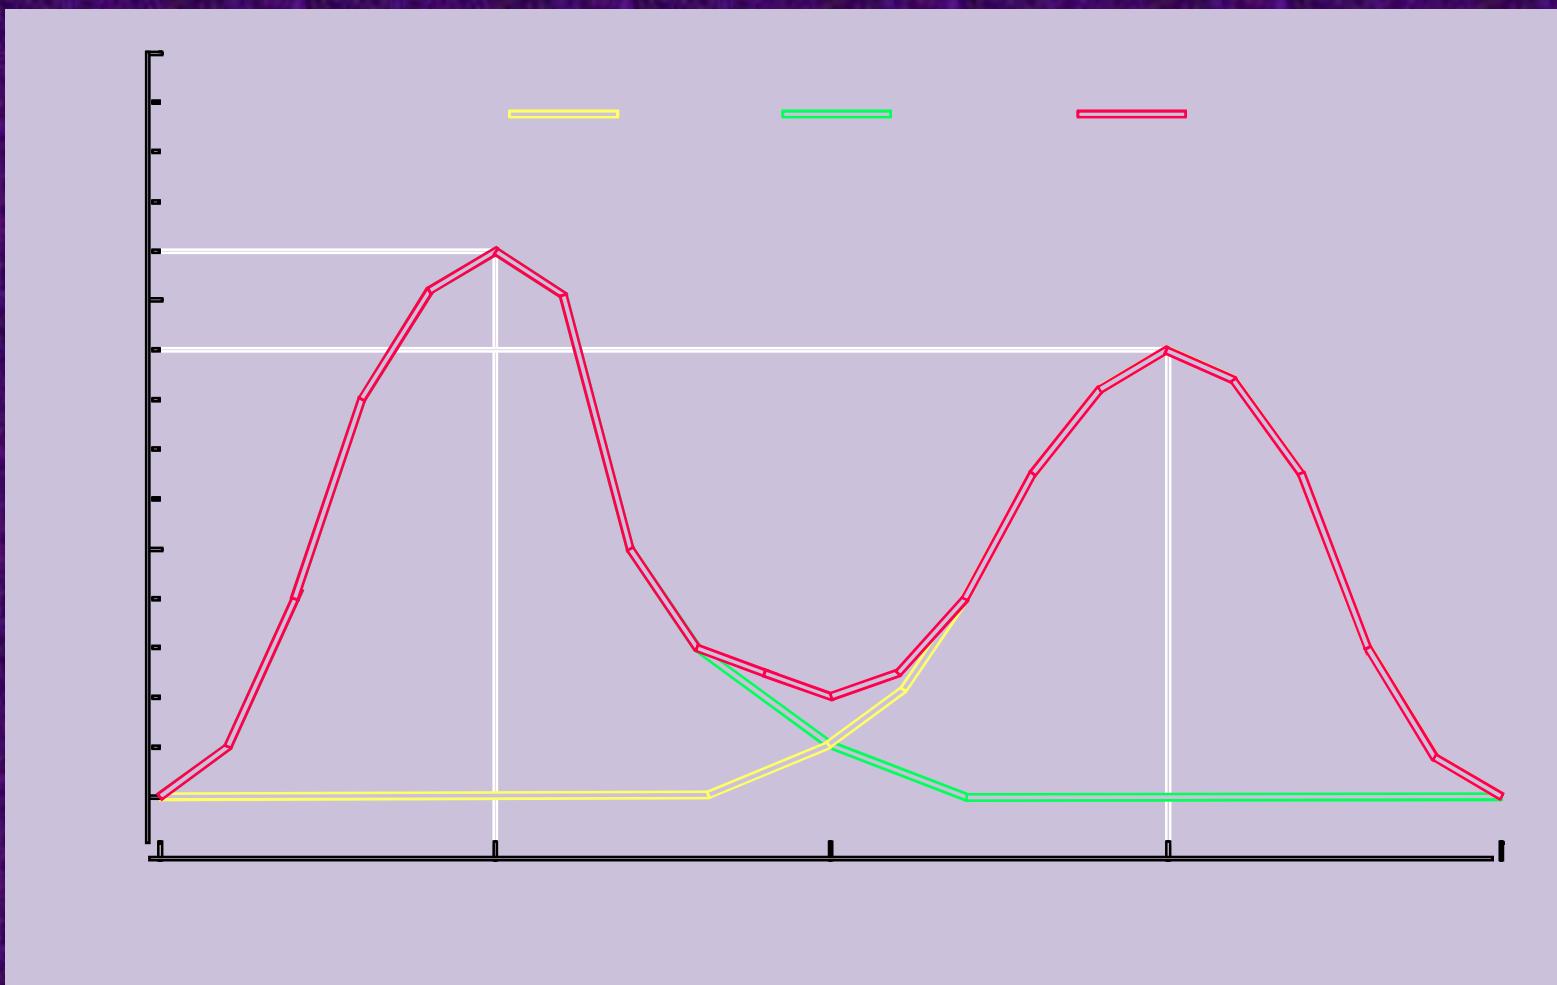

# Absorbance and Complementary Colors

The human eye sees the complementary color to that which is absorbed

Wavelength [nm]	Absorbed color	Complementary color
650-780	red	blue-green
595-650	orange	greenish blue
560-595	yellow-green	purple
500-560	green	red-purple
490-500	bluish green	red
480-490	greenish blue	orange
435-480	blue	yellow
380-435	violet	yellow-green

## A two-component mixture with little spectral overlap

# Ultraviolet-Visible Spectroscopy

- Introduction to UV-Visible
  - Absorption spectroscopy from 160 nm to 780 nm
  - Measurement of transmittance
    - Conversion to absorbance
      - $A = -\log T = \epsilon bc$
- Measurement of transmittance and absorbance
- Beer's law
- Noise
- Instrumentation

# Measurement

- Scattering of light
  - Refraction at interfaces
  - Scatter in solution
    - Large molecules
    - Air bubbles
- Normalized by comparison to reference cell
  - Contains only solvent
    - Measurement for transmittance is compared to results from reference cell

# Beer's Law

- Based on absorption of light by a sample
  - $dP_x/P_x = dS/S$ 
    - $dS/S =$  ratio of absorbance area to total area
      - Proportional to number of absorbing particles
    - $dS = adn$ 
      - $a$  is a constant,  $dn$  is number of particles
  - $n$  is total number of particles within a sample

$$-\int_{P_o}^P \frac{dP_x}{P_x} = \int_0^n \frac{adn}{S}$$

$$-\ln \frac{P_o}{P} = \frac{an}{S}$$

$$\log \frac{P_o}{P} = \frac{an}{2.303S}$$

# Beer's Law

- Area S can be described by volume and length
  - $S=V/b$  (cm<sup>2</sup>)
  - Substitute for S
  - $n/V$  = concentration
  - Substitute concentration and collect constant into single term  $\varepsilon$
- Beer's law can be applied to mixtures
  - $A_{\text{tot}}=\sum A_x$

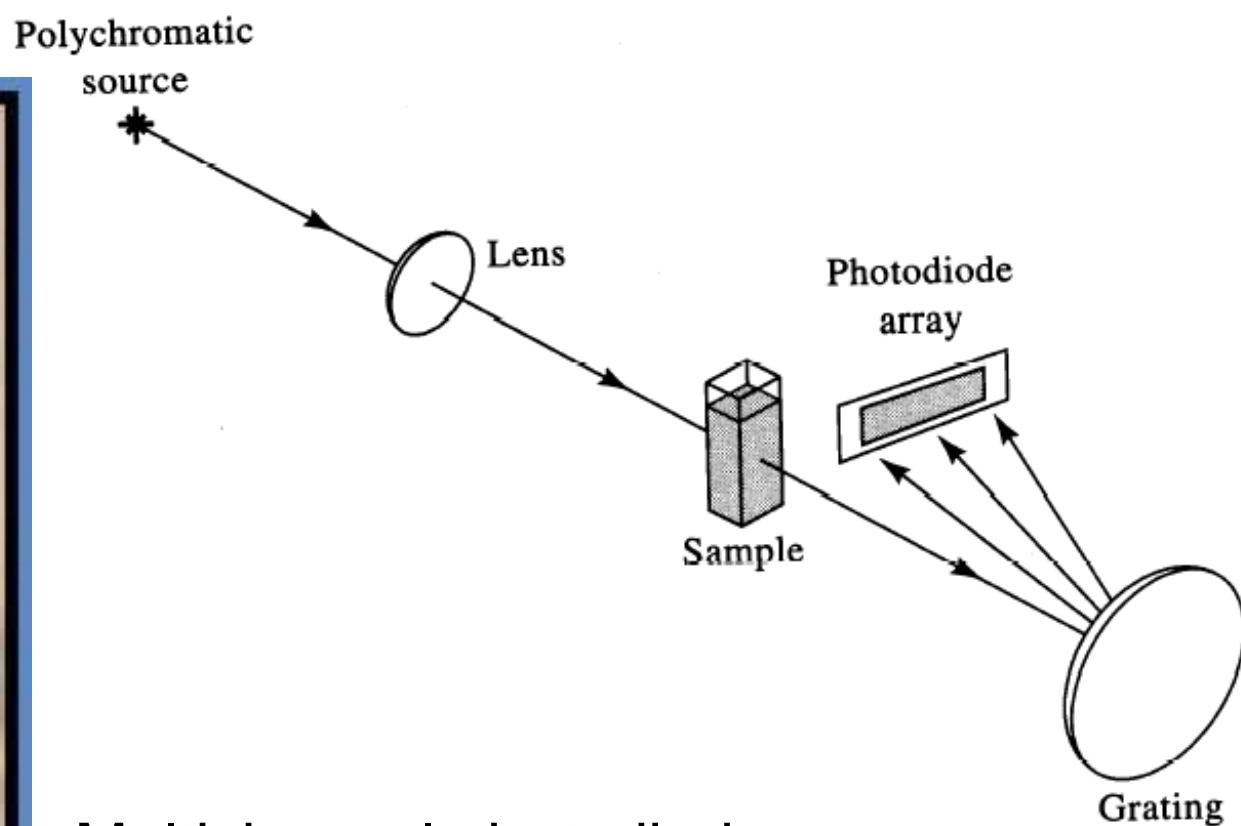

$$\log \frac{P_o}{P} = \frac{anb}{2.303V}$$

# Instrumentation

- Light source
  - Deuterium and hydrogen lamps
  - W filament lamp
  - Xe arc lamps
- Sample containers
  - Cuvettes
    - Plastic
    - Glass
    - Quartz

# Spectrometer

Dip probe

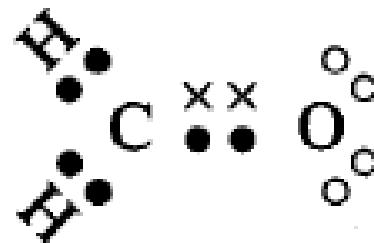

Multichannel photodiode array

# UV-Visible Spectroscopy--- Applications

- Identification of inorganic and organic species
- Widely used method
- Magnitude of molar absorptivities
- Absorbing species
- methods

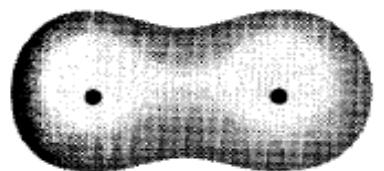

# Absorbing species

- Electronic transitions
  - $\pi$ ,  $\sigma$ , and n electrons
  - d and f electrons
  - Charge transfer reactions
- $\pi$ ,  $\sigma$ , and n (non-bonding) electrons

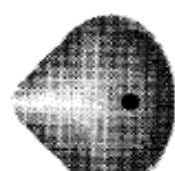

● =  $\sigma$   
× =  $\pi$   
○ =  $n$

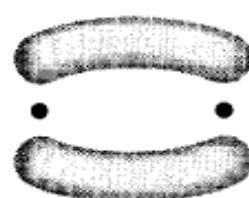

## Sigma and Pi orbitals

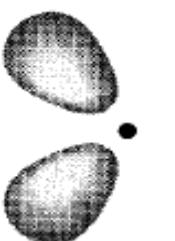

(a)  $\sigma$  orbital

(c)  $\sigma^*$  orbital

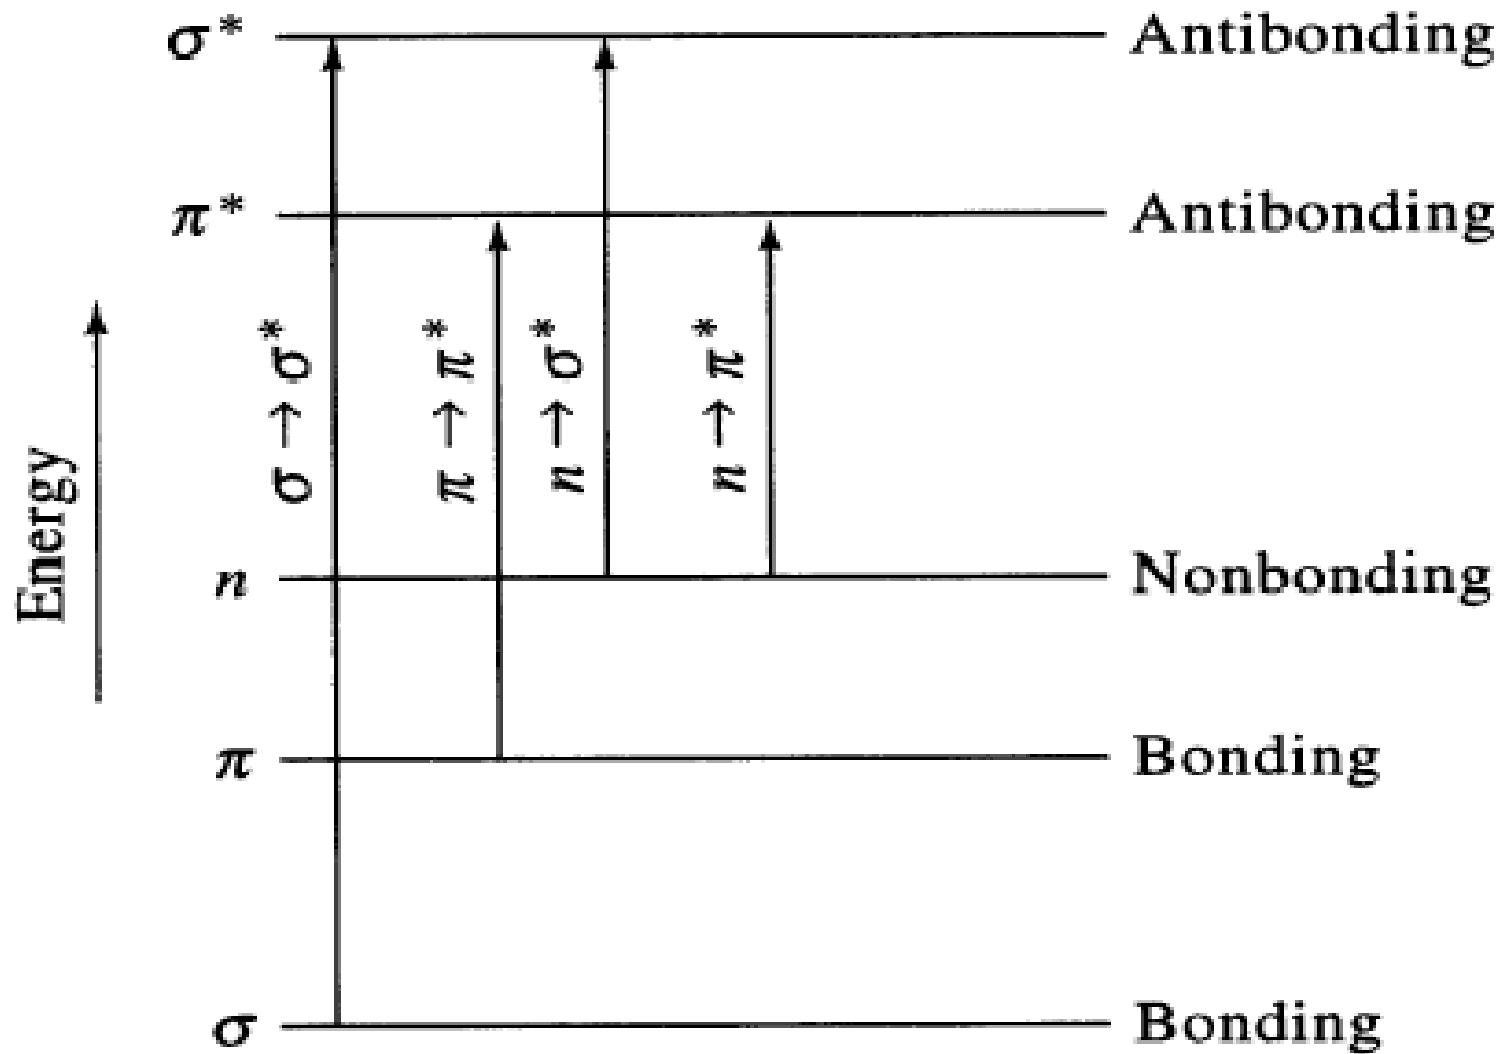

(b)  $\pi$  orbital

(d)  $\pi^*$  orbital

# Electron transitions

# Transitions

- $\sigma \rightarrow \sigma^*$ 
  - UV photon required, high energy
    - Methane at 125 nm
    - Ethane at 135 nm
- $n \rightarrow \sigma^*$ 
  - Saturated compounds with unshared  $e^-$ 
    - Absorption between 150 nm to 250 nm
    - $\epsilon$  between 100 and  $3000 \text{ L cm}^{-1} \text{ mol}^{-1}$
    - Shifts to shorter wavelengths with polar solvents
      - Minimum accessibility
  - Halogens, N, O, S

- $n \rightarrow \pi^*$ ,  $\pi \rightarrow \pi^*$ 
  - Organic compounds, wavelengths 200 to 700 nm
  - Requires unsaturated groups
    - $n \rightarrow \pi^*$  low  $\epsilon$  (10 to 100)
      - Shorter wavelengths
    - $\pi \rightarrow \pi^*$  higher  $\epsilon$  (1000 to 10000)

# Light Sources

## UV Spectrophotometer

1. Hydrogen Gas Lamp
2. Mercury Lamp

## Visible Spectrophotometer

1. Tungsten Lamp

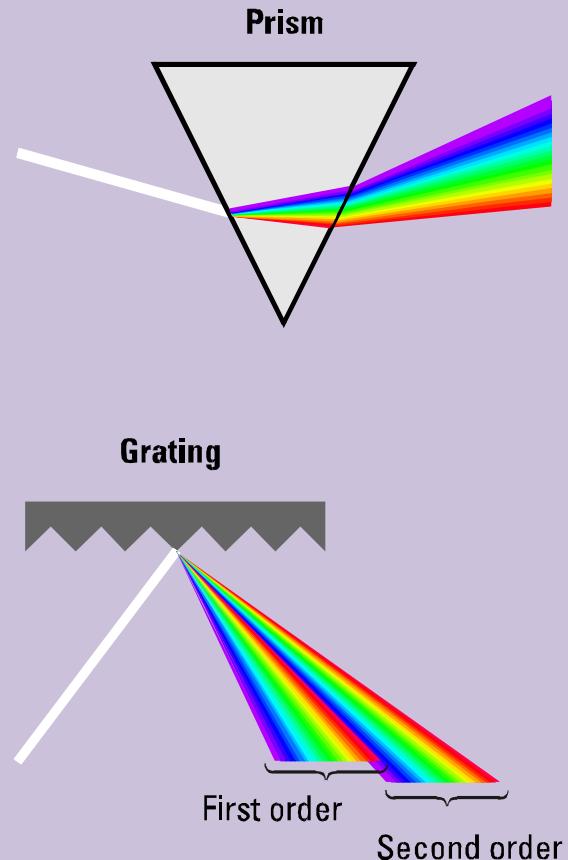

## InfraRed (IR) Spectrophotometer

1. Carborundum (SIC)

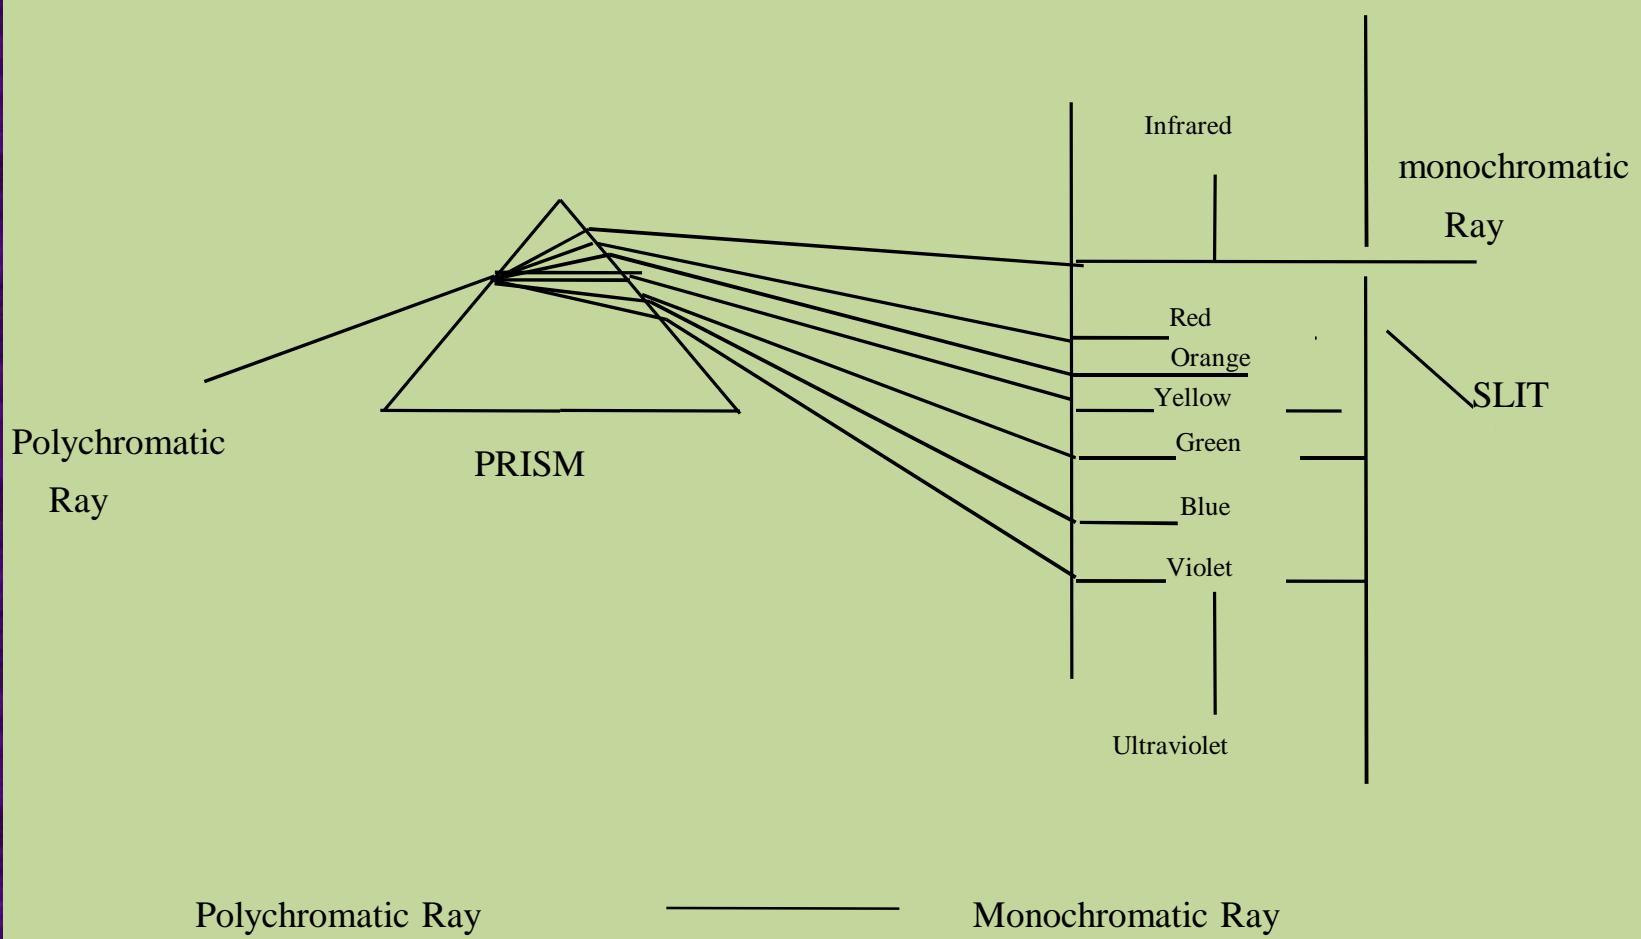

# Dispersion Devices

- Non-linear dispersion
- Temperature sensitive

- Linear Dispersion
- Different orders

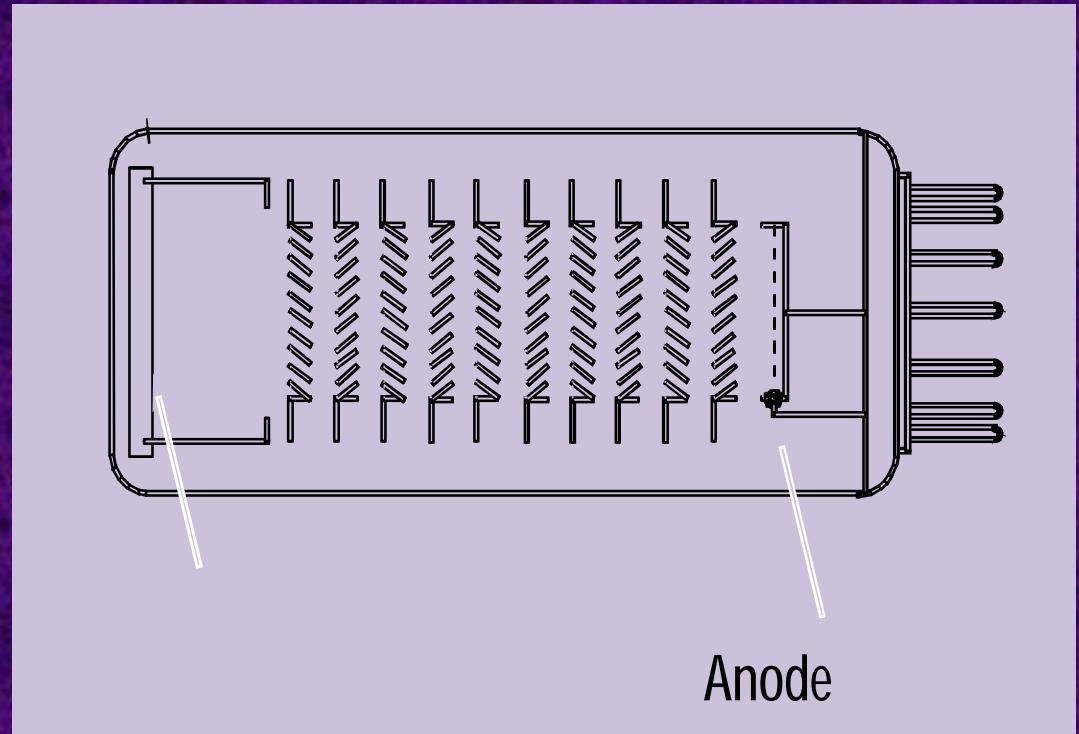

# Dispersion of polychromatic light with a prism

Prism - spray out the spectrum and choose the certain wavelength (l) that you want by moving the slit.

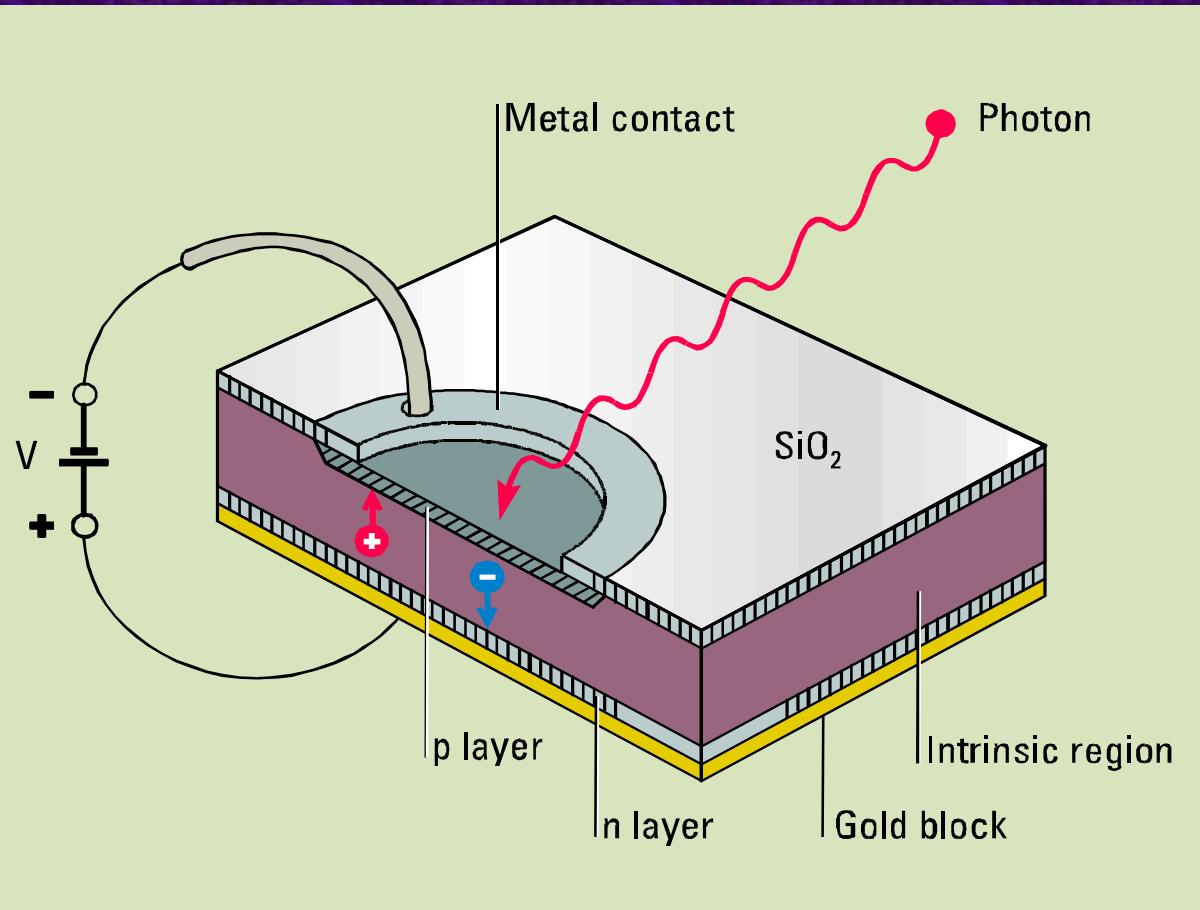

# Photomultiplier Tube Detector

- High sensitivity at low light levels
- Cathode material determines spectral sensitivity
- Good signal/noise
- Shock sensitive

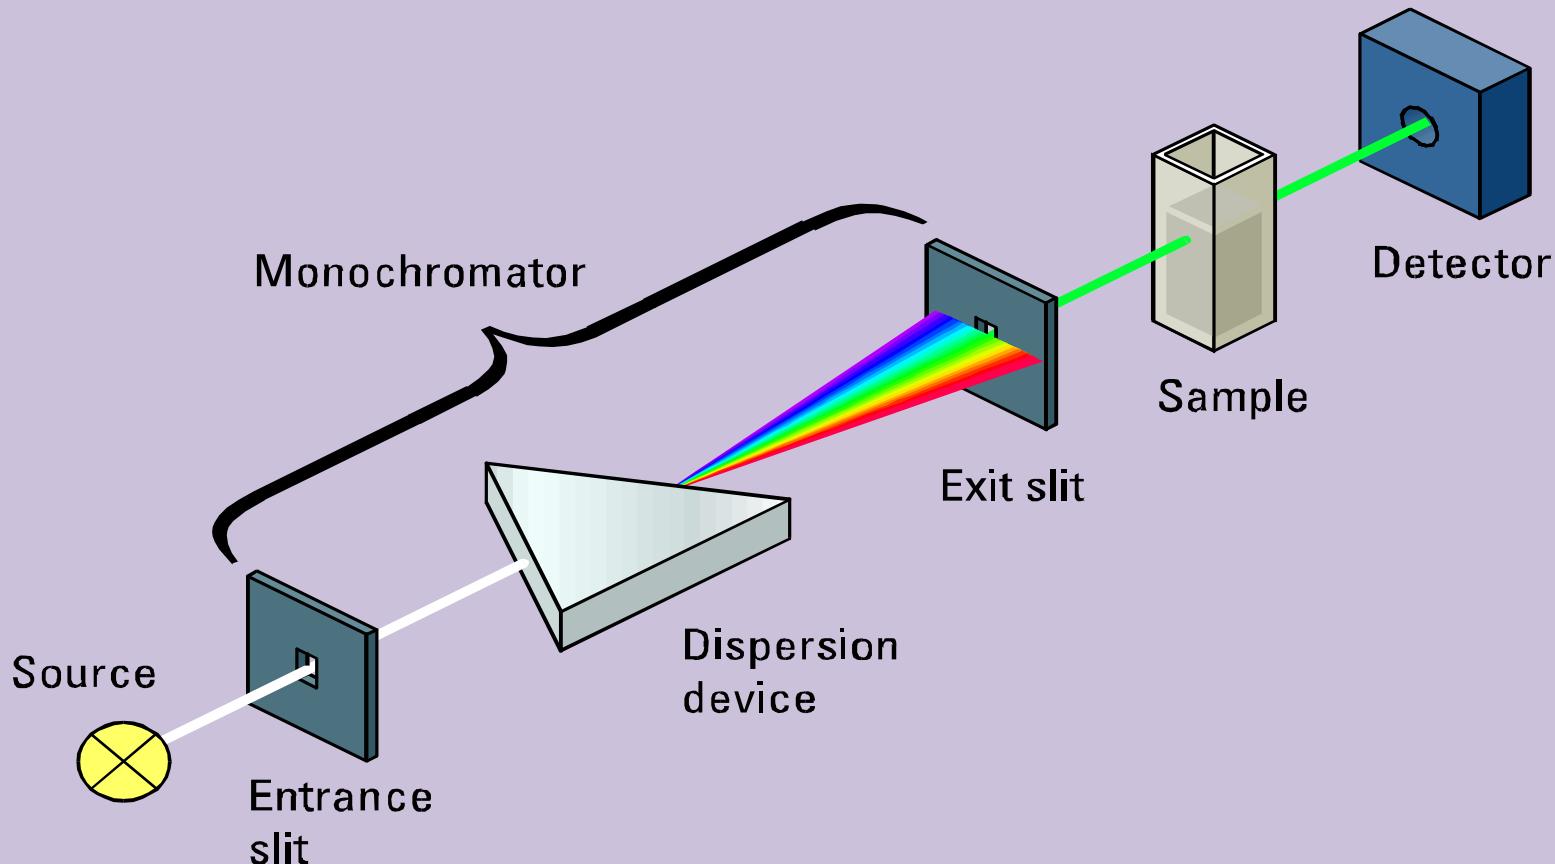

# The Photodiode Detector

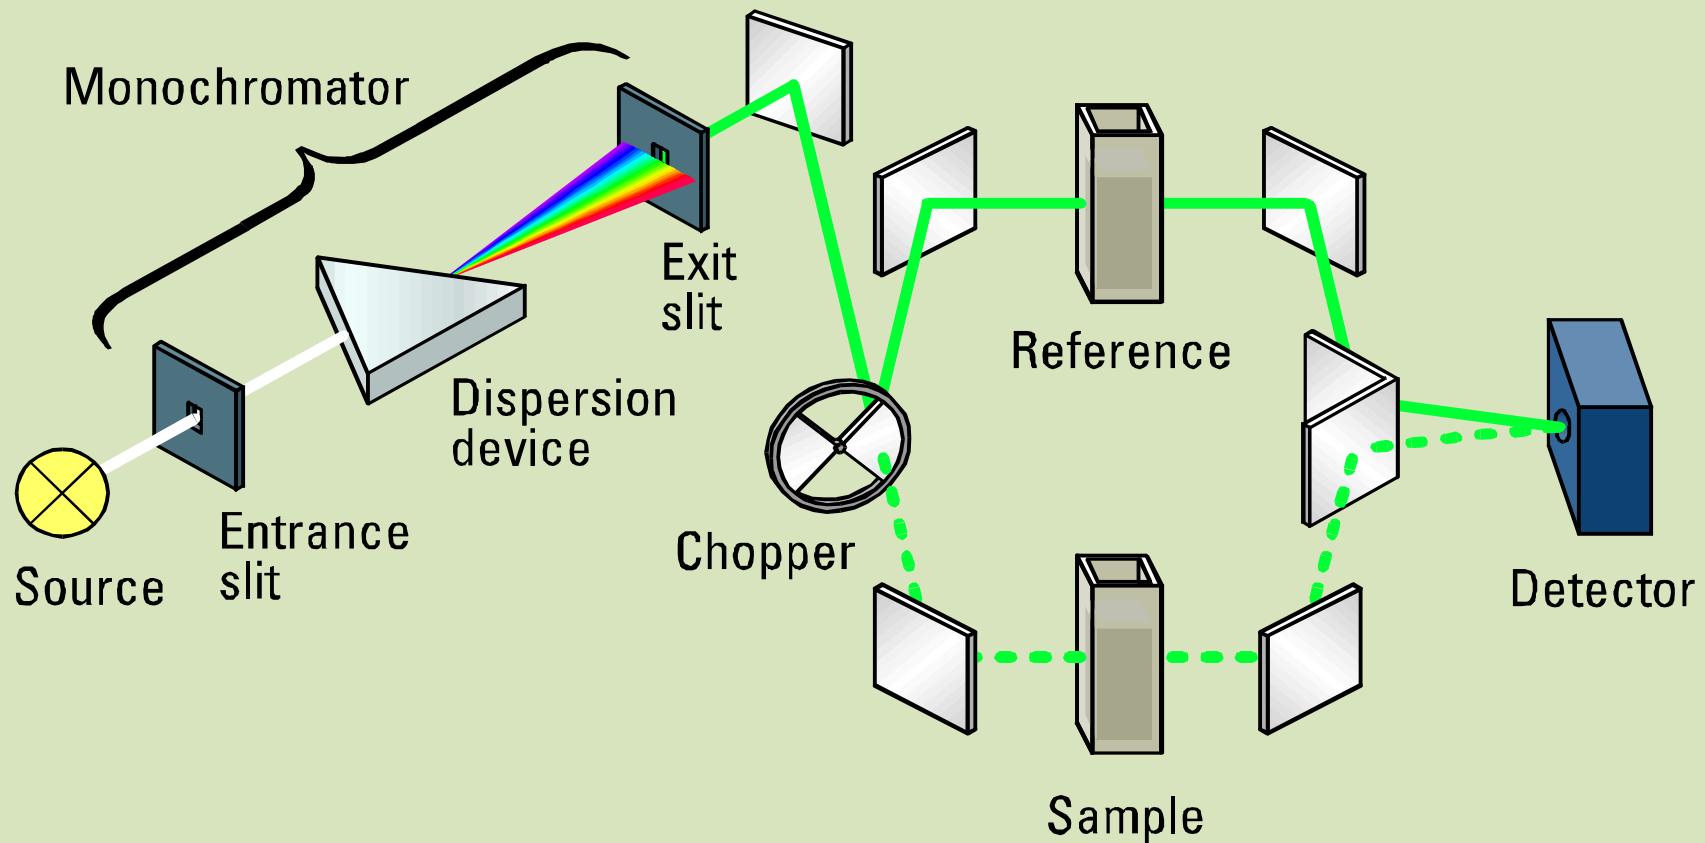

- Wide dynamic range
- Very good signal/noise at high light levels
- Solid-state device

# Conventional Spectrophotometer

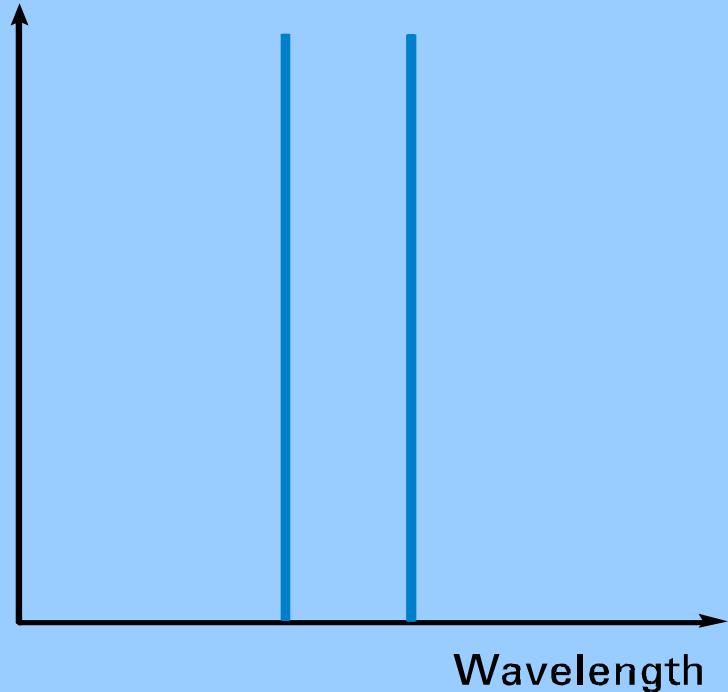

Schematic of a conventional single-beam spectrophotometer

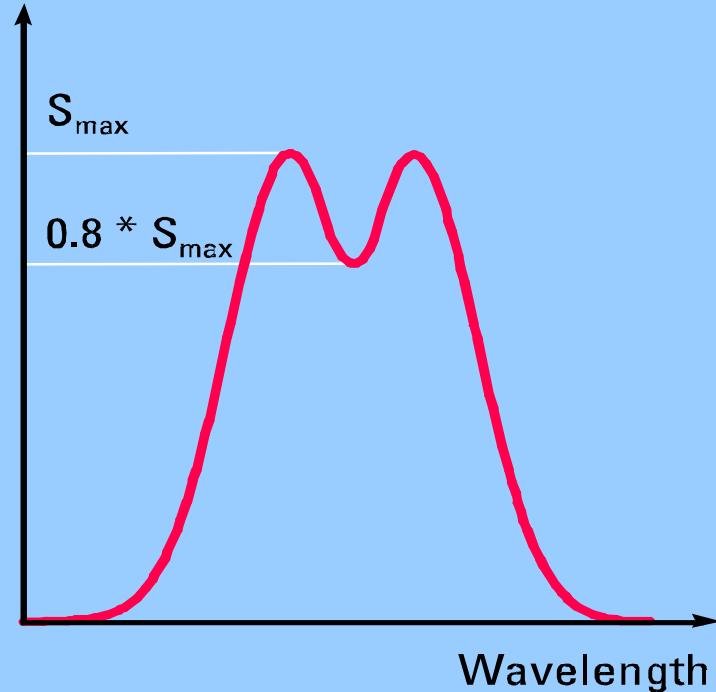

## Optical system of a double-beam spectrophotometer

# Resolution

Intensity

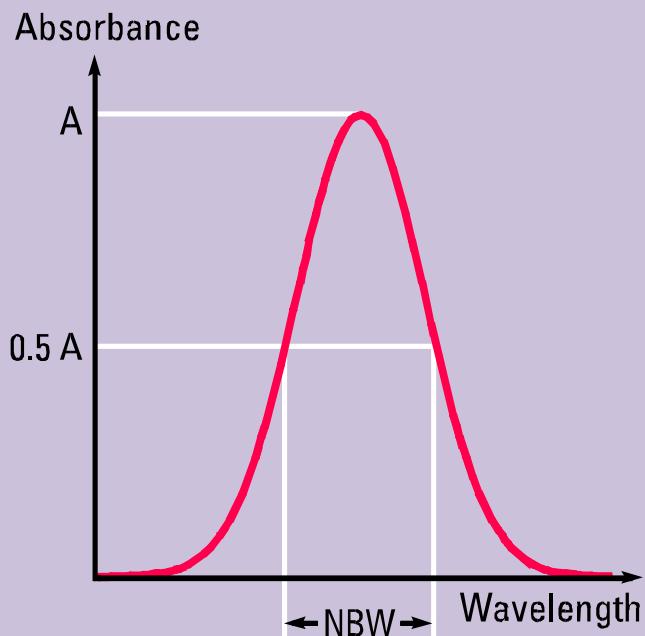

Detector  
output signal

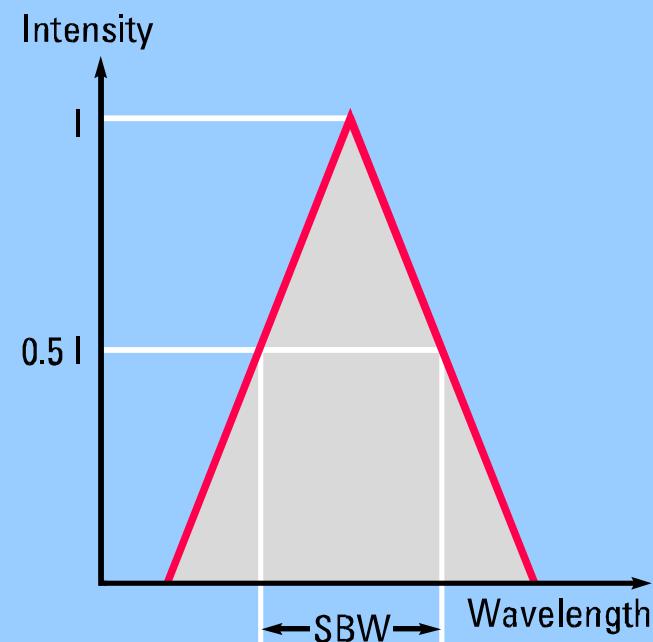

Spectral resolution is a measure of the ability of an instrument to differentiate between two adjacent wavelengths

## Natural Spectral Bandwidth

## Instrumental Spectral Bandwidth

The NBW is the width of the sample absorption band at half the absorption maximum

The SBW is defined as the width, at half the maximum intensity, of the band of light leaving the monochromator

# Cells

**UV Spectrophotometer**

**Quartz (crystalline silica)**

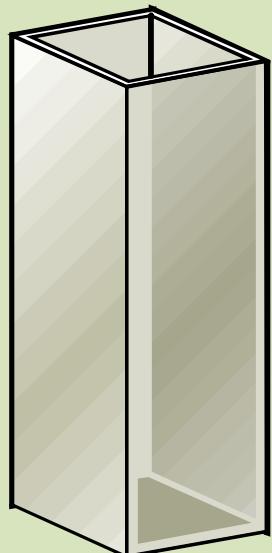

**Visible Spectrophotometer**

**Glass**

**IR Spectrophotometer**

**NaCl**

## Cell Types I

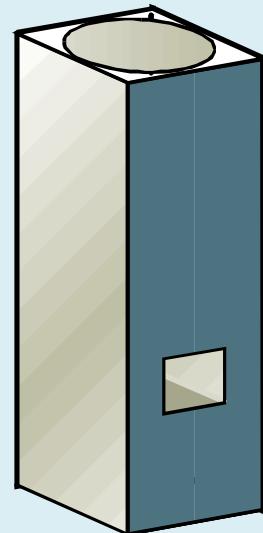

(a)

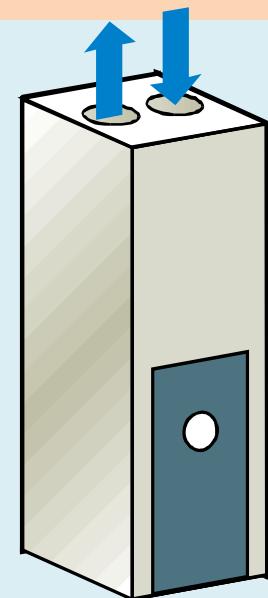

(b)

## Cell Types II

(a)

(b)

Open-topped rectangular standard cell  
(a) an apertured cell  
(b) for limited sample volume

2/6/2010

Micro cell (a) for very small volumes  
and flow-through cell  
(b) for automated applications

Molecular Spectroscopy 3.0

15

# The Bouguer-Lambert Law

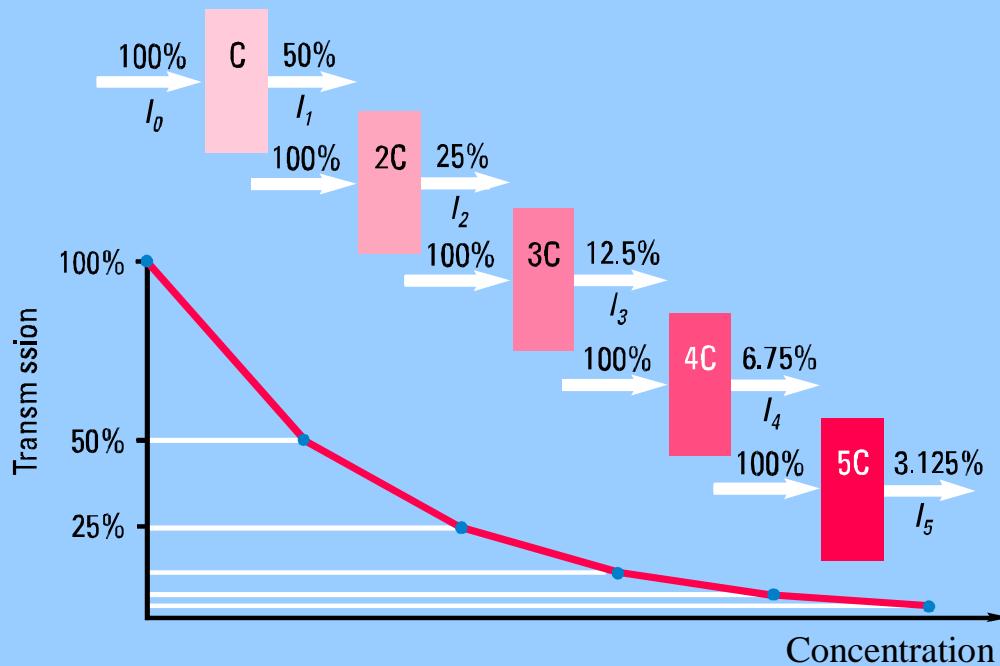

## Transmittance and Concentration

$$T = I / I_0 = e^{-\text{Const} \cdot \text{Pathlength}}$$

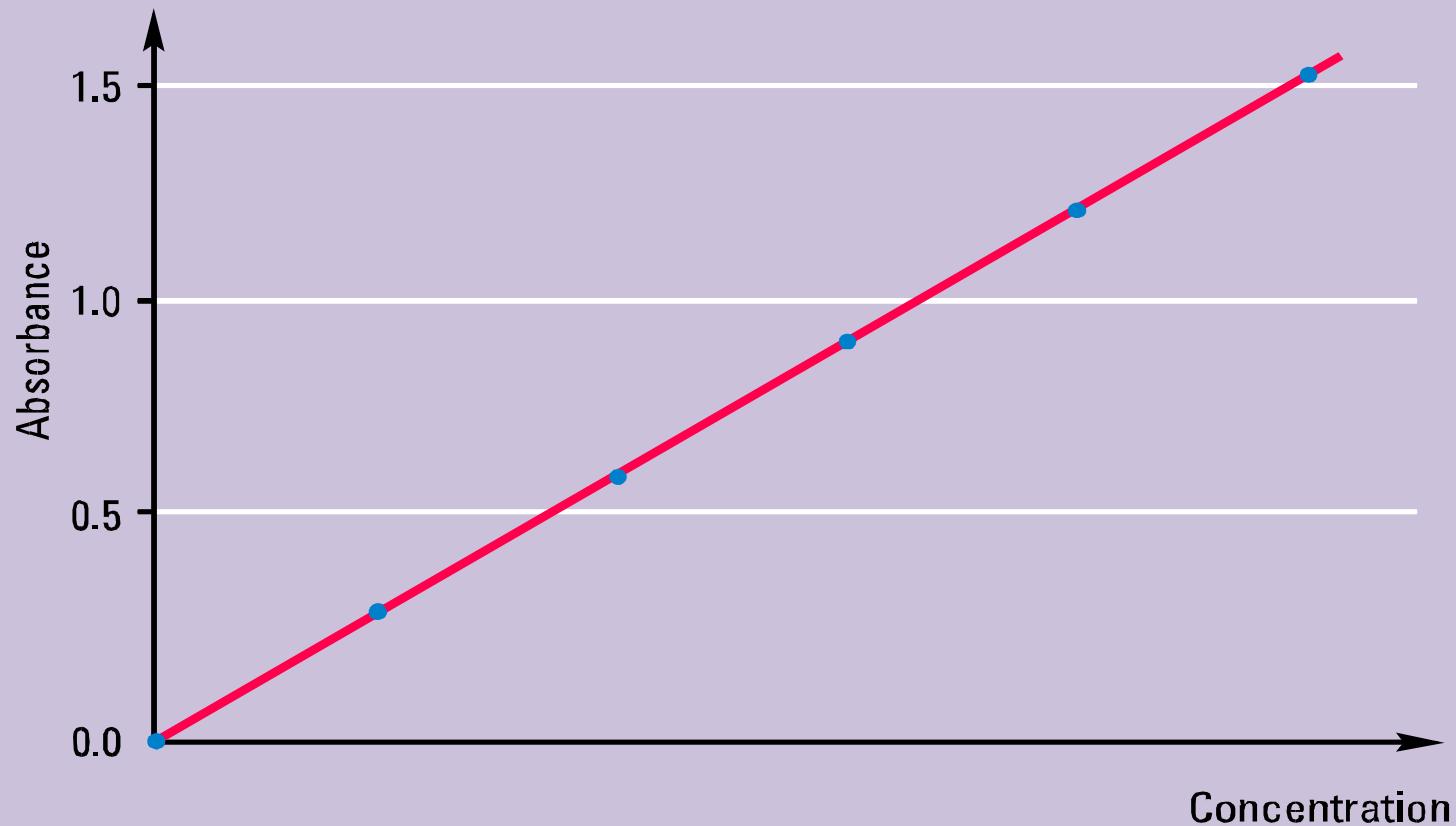

# Beer's Law

## Transmittance and Path Length

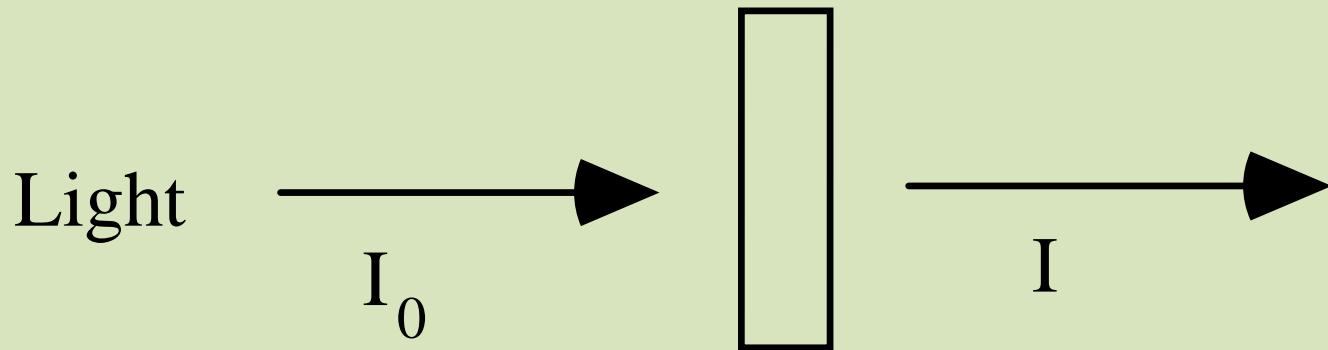

$$T = I / I_0 = e^{-\text{Const} \cdot \text{Concentration}}$$

# The Beer-Bouguer-Lambert Law

$$A = -\log T = -\log(I / I_0) = \log(I_0 / I) = \varepsilon \cdot b \cdot c$$

# BEER LAMBERT LAW

Glass cell filled with  
concentration of solution (C)

As the cell thickness increases, the intensity of I  
(transmitted intensity of light) decreases.
